                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a novel method for inhibiting inflammation which comprises administering a monoterpene composition that inhibits NFkappaB. The products of the invention have antiinflammatory,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antiarteriosclerotic, antirhumatic, antiarthrilic, osteopathic, antiparkinsonian, nootropic, neuroprotective and antiparkinsonian activity. The method described can be used for treating inflammatory diseases, particularly premalignant inflammatory disease (e.g. Barretts esophagitis, inflammatory bowel disease, chronic pancreatitis, chronic prostatitis, familial polyposis and actinic keratosis), artherosclerosis, rheumatoriod arthritis, osteoarthritis, multiple sclerosis, Parkinson's disease and Alzheimer's disease. This sequence represents a 32P-labelled NPkappaB oligonucleotide used in an electrophoretic mobility shift assay
                                                                                                                                               NFkappaB; antiinflammatory; antiarteriosclerotic; antirheumatic; antiarthritic; osteopathic; antiparkinsonian; nootropic; monoterpene; neuroprotective; antiparkinsonian. Barretts esophagitis; osteoarthritis; inflammatory bowel disease; chronic pancreatitis; chronic prostatitis; familial polyposis; actinic keracosis; rheumatoid arthritis; multiple sclerosis; Parkinson's disease; Alzheimer's disease; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inhibiting inflammation used for treating e.g. osteoarthritis and multiple sclerosis comprises administering monoterpene composition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             detect the biological characteristics of active triterpenes

rarget binding region #23.

```
AAT30581-T30614 represent target binding regions (TBR) of a probe of the invention. The probe of the invention contains a TBR, a booster binding region (BBR), and an optional support or attachment (OSA). The target binding assembly (TBA) recognised by the probe, contains at least one nucleic acid recognition unit (NAR) and optionally a linker sequence, an assembly sequence (see AAR95994-R95998), an asymmetry sequence (see AAR95007), and an OSA. The assembly sequence and asymmetry sequence (see AAR95993-R95993) are selected from NF-kappa-B, SPI, TATA, human papillomavirus (HBV) E2. HPV LTR, human immunodeficiency virus (HIV) LTR and Tat binding units. The linker sequence is an oligopetide, which does not interfere with NAR function, but provides stability and control over the spacing of the NAR from the rest of the TBA. The OSA is an attached support or indicator, or other means of localisation of the probe. The probe can be used in a method for detecting or localising a specific target nucleic acid sequences, including those found in human cells, in HIV, and other nucleic acid containing systems, including bacteria and

ANTIOSBI-T30614 represent target binding regions (TBR) of a probe of the invention. The probe of the invention contains a TBR, a booster binding cregion (BBR), and an optional support or attachment (OSA). The target binding assembly (TBA) recognised by the probe, contains at least one nucleic acid recognition unit (NAR), and optionally a linker sequence, an assembly sequence (see AARS95994-R95998), an asymmetry sequence (see AARS9599-R96006), a nuclear localisation signal sequence (see AARS9509).

CC ARS9599-R96006), a nuclear localisation signal sequences are responsible of the the OARS (see AARS96007), and an OSA. The assembly sequence and asymmetry sequence (see ARS9599) are selected from NF-Kappa B, SPI, TAPA, human papillomavirus (HPV) E2, HPV LTR, human immunodeficiency virus (HIV) LTR and Tat binding cuits. The linker sequence is an oligopeptide, which does not interfere with NAR function, but provides stability and control over the spacing of the NAR from the rest of the TBA. The OSA is an attached support or indiactor, or other means of localisation of the probe. The probe can be used in a method for detecting or localisation as profice carded edgree of specificity. The method is highly sensitive, and has a high edgree of specificity. The method can be used for detecting and edgree of specificity. The method can be used for detecting and edgree of specificity. The method can be used for detecting and edgree of specificity. The method can be used for detecting and edgree of specificity. The method can be used for detecting and edgree of specificity. The method can be used for detecting and edgree of specificity. The method can be used for detecting and edgree of specificity and contraining systems, including bacteria and Query Match Best Loca Matches RESULT 25 AAX28079 ò ö Gaps ; 0 Length 45; Indels Seguence 45 BP; 7 A; 12 C; 16 G; 10 T; 0 U; 0 Other; Score 29.2; DB 2; I Pred. The method is for inhibition of activation of the NF-kappaB transcription factor (A), for treatment of toxic or septic shock or graft versus host reactions in humans, comprises administration of curcumin (I, diferiloylmethane). (I) is used to treat toxic or septic shock and graft versus host reactions in humans. (I) may be used to inhibit activation of (A) e.g. in cases of radiation damage, atherosclerosis, cancer and human immune deficiency virus (HIV) infection. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Multiple myeloma; proliferation inhibition; apoptosis induction; curcumin; diferulcylmethane; chemotherapy potentiator; I-kappa-B kinase inhibitor; I-kappa-B-alpha phosphorylation suppressor; NF-kappa-B suppressor; I-kappa-B-alpha; Bcl-2; Bcl-XL; cyclin Di; interleukin-6; IL-6; cell cycle arrest; cytostatic; NF-kappa-B; HIV-1 LTR; long terminal repeat; electrophoretic mobility shift assay;

The invention relates to a method for inhibiting the proliferation of, and inducing apoptosis in multiple myeloma cells comprising and inducing apoptosis in multiple myeloma cells comprising cadministration of curcumin (diferuloy)methane). The invention also relates to a method for increasing the cytotoxic effects of a chemotherapeutic agent (e.g., vincristine, bichloroethylnitrosourea, chemotherapeutic agent (e.g., vincristine, prediisone or dexamethasone) against multiple myeloma cells (preferably CD138+ plasma cells) comprises administration of the chemotherapeutic agent against increases the cytotoxic effects of the chemotherapeutic agent against increases the cytotoxic effects of the chemotherapeutic agent against cultiple myeloma cells. It suppresses constitutive I-kappa-B-alpha chemothar constitutive I-kappa-B-alpha constitution of I-kappa-B-rapha activity, and convergulates the expression of I-kappa-B-regulated gene products (e.g. culpression of proliferation and arrest of cells at the GI/S phase of the cell cycle. The methods of the invention are used for the treatment of multiple myeloma. The present sequence represents an NF-kappa-B binding centuring myeloma. The present sequence represents an NF-kappa-B binding case a probe in electrophoretic mobility shift assay (EMSA) of NF-kappa-B in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               osteopathic; osteogenesis; nuclear factor kappa B; cancer; breast tumor; myeloma; osteoporosis; Paget's disease; rheumatoid arthritis; head and neck tumor; probe; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        à
                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                               The invention relates to a method of reducing or inhibiting osteoclast development induced by the receptor for activation of nuclear factor kappa B ligand (RANKL) by contacting the osteoclast or its precursor with compounds (I) comprising diferulcylmethane, guggulsterone, 1'-acetoxychavicol or their analogues. (I) is useful for reducing or inhibiting osteoclast development induced by RANKL, inhibiting the formation of osteoclast in an individual and reducing osteolytic activity and bone loss in an individual having breast cancer, multiple myeloma, post-menopausal osteoporosis, Paget's disease, rheumatoid arthritis or head and neck squamous cell carcinoma. The udierulcylmethane (curcumin) is safe to humans. This sequence corresponds to an electromobility shift assay (EMSA) probe used to analyze NF-kappaB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Oligo from HIV long terminal repeat containing NF-kappaB binding site.
                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nuclear factor-kappa B; NF-kappaB; NF-kappaB inhibitor; apoptosis stimulation; cancer; cytostatic; HIV long terminal repeat;
                                                 Use of compounds comprising diferuloylmethane, guggulsterone, 1'-acetoxycharicol or their analogues to e.g. reduce/inhibit osteoclast development induced by the receptor for activation of nuclear factor kappa B ligand.
                                                                                                                                                                                                                                                                       activation in curcumin-treated or untreated cells. The sequence is derived from the human immunoeficiency virus 1 long terminal repeat.

The present invention relates to cell permeable nuclear factor (NF)-
kappaB, and specifically to polypeptides that selectively inhibit NF-
kappaB, and specifically to polypeptides that selectively inhibit NF-
comprises (i) a protein transduction domain of the p65 subunit of NF-
combinity and (ii) a protein transduction domain which is able to transport
comprises cell membrane. The protein transduction domain which is able to transport
comprises cell membrane. The protein transduction domain is
derived from a protein or domain selected from third helix of the
conformation or domain selected from third helix of the
conformation of disclosed is an isolated DNA encoding the
conformation. Also disclosed is an isolated DNA encoding the
inhibitor. Provided is a method of inhibiting the DNA binding activity of
conformation of increasing the level of apoptosis; and a method
conformation a cell with the inhibitor above, where the
inhibitor suppresses NF-kappaB binding to DNA. Activity is induced by an
coll comprises contacting a cell with the inhibitor above, where the
inhibitor suppresses NF-kappaB binding to DNA. Activity is induced by an
coll comprises contacting a cell with the NFADPOL myritytate accetate
contacting accordate death domain (TRADD), TNF receptor-associated factor-
coll (TNF, kappaB-inducing Kinase (NIK), or IkappaBalpha kinase (IKK).
The present sequence is a 45-mer double-stranded oligonucleotide from the
coll DNA-brotein complex to examine the specificity of binding of NF-kappaB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Target binding assembly; nucleic acid recognition unit; NF-kappa-B; SP1; TATA; human papillomavirus; HPV; HPV E2; human immunodeficiency virus; HIV LTR; Tat binding unit; probe; assembly sequence; asymmetry sequence; nuclear localisation signal sequence; human cell; HPV LTR; HIV; bacteria;
                                                                             New cell permeable nuclear factor kappaB inhibitor comprising a peptide fragment and a protein transduction domain, useful for treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

invention. The probe of the invention contains a TBR, a booster binding region (BBR), and an optional support or attachment (OSA). The target region (BBR), and an optional support or attachment (OSA). The target binding assembly (TBA) recognised by the probe, contains at least one nucleic acid recognition unit (NAR), and optionally a linker sequence, assembly sequence (see AAR95994-R95998), an asymmetry sequence (see AAR96007), and an OSA. The assembly sequence and asymmetry sequence (see AAR96007), and an OSA. The assembly sequence and asymmetry sequence are responsible for the folding and association of the NARS. The NARS (see AAR95965-CC (BPV) E2. HPV LTR, human immunodeficiency virus (HIV) LTR and Tat binding units. The linker sequence is an oligopeptide, which does not interfere viru NAR function, but provides stability and control over the spacing of the NAR from the rest of the TBA. The OSA is an attached support or indicator, or other means of localisation of the probe. The probe can be used in a method for detecting or localising a specific target nucleic acid sequence (TNA). The method is highly sensitive, and has a high control acid sequence (TNA). The method can be used for detecting specific carded acquence including those found in human calls, in HIV, hum can obtain a method of the probe found in human calls, in HIV, hum can obtain a health of the probe of the hard of the probe of the AAT30581-T30614 represent target binding regions (TBR) of a probe of the Probe nucleic acids, target binding assemblies, etc - for detection and localisation of specific nucleic acid sequences, esp. Probe nucleic acids, target binding assemblies, etc - for detection and

ART30581-T30614 represent target binding regions (TBR) of a probe of the invention. The probe of the invention contains a TBR, a booster binding convention. The probe of the invention contains a TBR, a booster binding assembly (TBA) recognised by the probe, contains at least one nucleic acid recognition unit (NAR), and optionally a linker sequence, an assembly sequence (see AARS5994-R9598), an asymmetry sequence (see AARS5999-R96006), a nuclear localisation signal sequence (see AARS9993) are association of the NARs. The NARs (see AARS9607), and an OSA. The assembly sequence and asymmetry sequences are responsible (for the folding and association of the NARs. TATA, human papillomavirus (HPV) E2, HPV LTR, human immunodeficiency virus (HIV) LTR and Tat binding (HPV) E2, HPV LTR, human immunodeficiency virus (HIV) LTR and Tat binding with NAR function, but provides stability and control over the spacing of the NAR from the rest of the TBA. The OSA is an attached support or indicator, or other means of localisation of the probe. The probe can be used in a method for detecting or localisation as profice carpet nucleic acid sequence (TNA). The method is highly sensitive, and has a high charter acid sequences, including those found in human calls, in HIV, HPV, and other nucleic acid containing systems, including bacteria and localisation of specific nucleic acid sequences, esp. HIV and HPV. Disclosure, Page 71; 172pp; English.

Probe nucleic acids, target binding assemblies, etc - for detection and localisation of specific nucleic acid sequences, esp. HIV and HPV.

Disclosure; Page 70; 172pp; English,

AAT30581-T30614 represent target binding regions (TBR) of a probe of the invention. The probe of the invention contains a TBR, a booster binding region (BBR), and an optional support or attachment (OSA). The target binding assembly (TBA) recognised by the probe, contains at least one nucleic acid recognition unit (NAR) and optionally a linker sequence, an assembly sequence (see AAR5994-R95998), an asymmetry sequence (see AAR9599-R96006), an unclear localisation signal sequence (see AAR96007), and an OSA. The assembly sequence and asymmetry sequence (see AAR9599-R96006), and an OSA. The assembly sequence and asymmetry sequence (see AAR95993) are selected from NF-kappa-B, SPI, TATA, human papillomavirus (HPV) E2, HPV LTR, human immunodeficiency virus (HIV) LTR and Tat binding units. The linker sequence is an oligopeptide, which does not interfere with NAR function, but provides stability and control over the spacing of the NAR from the rest of the TBA. The OSA is an attached support or indiactor, or other means of localisation of the probe. The probe can be used in a method for detecting or localising a specific target nucleic acid sequences. Including those found in human calls, in HIV, HV, and other nucleic acid containing systems, including bacteria and viruses

Probe nucleic acids, target binding assemblies, etc - for detection and localisation of specific nucleic acid sequences, esp. HIV and HPV. WPI; 1996-287199/29.

Disclosure; Page 70; 172pp; English.

AAT30581-T30614 represent target binding regions (TBR) of a probe of the invention. The probe of the invention contains a TBR, a booster binding

region (BBR), and an optional support or attachment (OSA). The target binding assembly (TBA) recognised by the probe contains at least one nucleic acid recognition unit (NAR), and optionally a linker sequence, an assembly sequence (see AAR95994-R95998), an asymmetry sequence (see AAR96007), and an OSA. The assembly sequence and asymmetry sequence (see AAR96007), and an OSA. The assembly sequence and asymmetry sequence (see AAR96007), comparing the NAR95999-R96006), a nuclear localisation signal sequence (see AAR96007), and and association of the NAR9. The NAR8 (see AAR95965-CC (HRV) EZ, HPV LTR, human immunodeficiency virus (HIV) LTR and Tat binding units. The linker sequence is an oligopeptide, which does not interfere with NAR from the rest of the TBA. The OSA is an attached support or indicator, or other means of localisation of the probe. The probe can be used in a method for detecting or localisation of the probe. The probe can be cade sequence (TNA). The method is highly sensitive, and has a high degree of specificity. The method can be used for detecting specific acid sequences, including those found in human calls, in HIV, HIV, and other nucleic acid containing systems, including bacteria and

Ikaros poly:peptide(s) - useful for treating disorders of immune system or corpus striatum

Disclosure; Col 27; 111pp; English.

The present invention describes a purified peptide having at least one of the following properties: (a) it stimulates transcription of a DNA sequence under the control of a delta A element, an NFKB element or an Ikaros binding oligonucleotide consensus sequence; (b) it binds to any of

a delta A element, an NFKB element or an Ikaros binding oligonucleotide consensus sequence; (c) it competitively inhibits the binding of a naturally occurring Ikaros isoform to any of a delta A element, an NFKB element or an Ikaros binding oligonucleotide consensus sequence; (d) it competitively inhibits Ikaros binding to Ikaros responsive elements; or (e) it inhibits protein-protein interactions of transcriptional complexes formed with naturally occurring Ikaros isoforms. The proteins, provided that they stimulate gene transcription under the control of delta A elements, NFKB elements and/or Ikaros-binding oligonucleotides, bind to delta A elements, NFKB elements and/or Ikaros-binding oligonucleotides, competitively inhibit binding of naturally occurring Ikaros isoforms to delta A elements and/or Ikaros-binding oligonucleotides, competitively inhibit Ikaros binding of Ikaros-responsive elements and/or inhibit protein-protein interactions of transcriptional complexes with naturally occurring Ikaros isoforms, can be used to treat immune system disorders, e.g. leukaemia or AIDS, or corpus striatum disorders, e.g. Alzheimer's disease. AAV6655 to AAV67118 represent oligonucleotides given in the present invention

I-cell pathway regulatory gene, Ikaros - encodes family of unique zinc finger proteins, useful for treating immune system disorders.

Disclosure; Page 29; 112pp; English.

The Ikaros gene encodes a zinc finger protein which can be used in a therapeutic composition to treat animals with an immune system disorder. It may also be used for assessing whether a subject is at risk for an immune disorder. It is of particular use in treating a disorder of the corpus striatum. Heterologous genes may be expressed by placing them under the control of an Ikaros responsive control element and contacting the element with an Ikaros protein. Potential high affinity binding sites 

AAT30615-T30634 represent probe nucleic acids of the invention. The probe of the invention contains a target binding region (TBR), a booster binding region (BBR), and an optional support or attachment (GSA). The target binding assembly (TBA) recognised by the TBR (see AAT30581-T30614) of the probe, contains at least one nucleic acid recognition unit (NAR), of the probe, an asymmetry sequence, an assembly sequence (see AAR96007), and an OSA. The assembly captured and asymmetry sequence (see AAR96007), and an OSA. The assembly sequence and asymmetry sequences are responsible for the folding and sequence and asymmetry sequences are responsible for the folding and sequence is an oligopeptide, which does not interfere with NAR function, but provides stability and control over the spacing of the NAR function, but provides stability and control over the spacing of the NAR function, capt the TBA. The OSA is an attached support or indicator, or other means of localisation of the probe. The probe can be used in a method for ö for the Ikaros proteins were found in the enhancer and promoter regions of the TCR-alpha, -beta and -delta, the CD3-delta, -epsilon and -gamma genes, the SL3 and HIV long terminal repeat and in the regulatory domains of other T cell restricted antigens. Related sequences to the Ikaros motif were also found in the purine boxes of the IL2 gene in the in the HIV purp site of the TDT promoter as well as in the NFkB variant sites of the HIV long terminal repeat. See also AAQ61504-Q61543. (Updated on 25-MAR-2003 to correct PN field.) It partially includes a core motif GGGAA found in consensus recognition sites of murine Ikaros isoforms mIk-1, mIk-2 and mIk-3 (see AAV52830-32). High affinity binding sites for Ikaros have been found in enhancer and promoter regions of the regulatory domains of the TCR antigen complex, the CD3 genes, the SL3 and HIV long terminal repeat and in the regulatory domains of other T cell restricted antigens (see AAV45358-402) by gel retardation assay. Ikaros is involved in early differentiation of lymphocytes, The invention provides Ikaros incleic acids (see AAV42805-11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           and AAV42840) and polypeptides, vectors and host cells. These are used to treat T and B cell diseases, to control expression of heterologous genes placed under control of an Ikaros-responsive element, to treat nervous system diseases and to modulate cell division, amplification or
detecting or localising a specific target nucleic acid sequence (TNA).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ဌ

The invention relates to an animal with a structurally intact Tp12 gene but functionally disrupted endogenous Tp12 (a protooncogene which encodes continually disrupted endogenous Tp12 (a protooncogene which encodes consistance to lipopolysaccharide induced endocoxin shock or tumour careaistance to lipopolysaccharide induced endocoxin shock or tumour can do Tp12 protein. Tp12 is useful for treating thematoid cartifitis. TNRalpha-mediated inflammatory diseases. Tp12 protein current in Tp12 is useful for treating rheumatoid arthritis. TNRalpha-mediated inflammatory diseases or LpS induced carbotoxin shock, may be treated by transfecting bone marrow derived cells invitro with a DNA construct which encodes sequences that interferes with the expression of function of the endogenous Tp12 in the cells and administering the cells to an animal. The knock out animals and the constructs used to generate the animals are useful in the development of compositions and methods of treating inflammation. Tp12 agonist and antagonist are useful as targets for the development of novel the novel cagnits which eliminate the functional role of Tp12 and as research tools confict and protein interactions involved in inflammatory disorders. Tp12 polymucleotide sequences facilitate the discovery and development of antice endotoxin shock and/or antinflammatory compounds. The present sequence is human immunodeficiency virus LTR NF-kB-specific (funclear factor kappa in interaction in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an animal with a structurally intact Tp12 gene but functionally disrupted endogenous Tp12 (a protooncogene which encodes a cytoplasmic serine threonine protein kinase). The animal has increased resistance to lipopolysaccharide-induced endotoxin shock or tumour and DNA are useful for identifying compounds that agoinse or inhibit the cumour of Tp12 in useful for treating rheumatoid arthritis. TNFalpha-mediated inflammatory diseases Tp12 protein arthritis. TNFalpha-mediated inflammatory diseases or LPS induced arthritis. TNFalpha-mediated but ansisfecting bone marrow derived cells invitro with a DNA construct which encodes sequences that interferes with the expression of function of the endogenous Tp12 in the cells and constructs used to generate the animals are useful in the development of compositions and methods of treating inflammation. Tp12 agonist and constructs used to generate the animals are useful in the development of compositions and methods of treating inflammation. Tp12 agonist and an animal animals are useful in the development of compositions and methods of treating inflammation. Tp12 and as research tools to facilitate the elucidation of the mechanistic action of the novel constructs and protein interactions involved in inflammatory disorders. Tp12 protein interactions involved in inflammatory disorders. Tp12

```
The present invention provides assays for identifying compounds which modulate NF-kappaB. NF-kappaB, along with IgNF-A, IgNF-E and IgNF-B, i lymphoid cell nuclear factor which regulates the transcription of the immunoglobulin genes. The modulators are useful in the control of activation of host cells
                                                                             DNA
                                                                          Identifying an NF-kappa B modulator, useful for analyzing protein DNA interactions in cells or in identifying transcriptional regulatory factors by detecting NF-kappa B or IKB DNA binding activity level or cytoplasmic localization.
                                                                                                                                                                                                                                                                                                                                    Gaps

The invention describes an isolated nuclear protein NF-kappaB (I) which binds: in a sequence specific manner, to a transcriptional regulatory DNA clement of an immunoglobulin light or heavy chain genes, or both; in a sequence specific manner, to enhancer DNA sequences of the kappa light chain gene; or to DNA sequences in the upstream region of both mouse cheavy and kappa light chain gene promoters, and to DNA sequences of mouse cheavy chain gene enhancer. (I) is useful for enhancing the transcription of the gene enhancer, and for screening for expression of sequence specific binding protein. A polyclonal or monoclonal antibody (II) specific binding protein. A polyclonal or monoclonal antibody (II) specific manner, to a transcriptional regulatory DNA element of an immunoglobulin light or heavy chain gene, or both is useful in an immunoglobulin light or heavy chain gene, or both is useful in a cimmunoglobulin light or heavy chain gene. To both is useful in a biological fluid, where (II) is specifically reacts with light-BAPPAB or NF-kappaB. DNA (III) encoding the DNA binding domain of (I) is useful for specifically stimulating gene transcription comprising (III) linked to DNA encoding an activator of the RNA polymerase for the gene, and introducing the construct into the cell.
                                                                                                                                                                                                          Novel isolated nuclear protein NF-kappaB that binds in sequence specific manner to transcriptional regulatory DNA element of immunoglobulin light or heavy chain genes, or both, useful for enhancing transcription of gene

shock protein, useful in the treatment of transplant rejection, autoimmune diseases and cancer.
                                                                                                                                                            The present sequence is a primer which was used to determine the concentration of a fusion protein in an electrophoretic mobility shift sasay. The fusion protein comprised the C-terminuus of the 70kD heat shock protein (HBp70), and the p50 subunit of transcription factor NF-kappaB. The fusion protein was created in order to determine the ability of the HBp70 sequence to direct other proteins into the cell. It was shown that HBp70 fragments are able to direct other proteins into the cell, a feature which can be used in the treatment of transplant rejection, autoimmune diseases such as rheumatoid arthritis, multiple

to 377 of the coding strand sequence of the HIV-1 LAI 5' long terminal repeat (LTR), and including an added KpnI restriction site. This was used as 5' primer, with the 3' primer given in ACF05496, to amplify a 186 bp fragment of the 5' LTR (nucleotides 345-531) for use in the plasmid construct pLTR(345-531)-luc. This plasmid was used to demonstrate the trichostatin-A (TSA) inducibility of HIV-1 LTRs and also to show that intact kappaB sites are required for maximal TSA inducibility of the HIV-1 promoter. The invention relates to the use of a deacetylase inhibitor (e.g. TSA) combined with one or more compounds used in a viral treatment for the manufacture of a medicament for obtaining elimination of integrated, functional and pathogenic viruses, e.g. HIV-1, in a mammal cell, including a human cell. This allows significant elimination and possible suppression of the presence of virus in a patient and therefore
                                                                                                                                                                                                                                                                                                                                                                                                                                        improves long-term control of viral infections in patients receiving highly active antiretroviral therapy (HAART) treatment

Probe nucleic acids, target binding assemblies, etc - for detection and localisation of specific nucleic acid sequences, esp. HIV and HPV.

Disclosure; Page 72; 172pp; English.

AAT30581-T30614 represent target binding regions (TBR) of a probe of the invention. The probe of the invention contains a TBR, a booster binding region (BBR), and an optional support or attachment (OSA). The target binding assembly (TBA) recognised by the probe, contains at least one nucleic acid recognition unit (NAR), and optionally a linker sequence, an assembly sequence (see AAR95994-R95998), an asymmetry sequence (see AAR95994-R95998), an asymmetry sequence (see AAR96007), and an OSA. The assembly sequence and asymmetry sequence sare responsible for the folding and association of the NARS. The NARS (see AAR95065-

```
R95993) are selected from NF-kappa-B, SP1, TATA, human papillomavirus (HPV) E2, HPV LTR, human immunodeficiency virus (HIV) LTR and Tat binding units. The linker sequence is an oligopeptide, which does not interfere with NAR function, but provides stability and control over the spacing of the NAR from the rest of the TBA. The OSA is an attached support or indicator, or other means of localisation of the probe. The probe can be used in a method for detecting or localising a specific target nucleic acid sequence (TNA). The method is highly sensitive, and has a high andleic acid sequences, including those found in human cells, in HIV, HPV, and other nucleic acid containing systems, including bacteria and

Treating uro-genital conditions, such as vaginitis, cystitis, urethritis, or balanoposthitis comprises using alpha-melanocyte stimulating hormone or a derivative of it. 

Example 9; Page 15; 37pp; English.

The present sequence is an oligonucleotide used to determine the level of NF-kB activity in human UI cells treated with alpha-melanocyte stimulating hormone (alpha-MSH). Alpha-MSH and its derivatives were shown to inhibit TNF-alpha induced NF-kB activation and binding. Alpha-MSH and its derivatives have potent antipyretic and antiinflammatory properties, yet they have extremely low toxicity. A uro-genital condition treatment system has been developed that complises a carrier and a polypeptide including a sequence derived from alpha-MSH. The system may be used to treat a uro-genital condition such as vaginitis, cystitis, urethritis, or balanoposthitis. It may also be used to prevent toxic shock syndrome and infection from sexually transmitted diseases, and to treat an antibiotic resistant microorganism. The polypeptides used in the treatment system

The alpha-MSH is useful for combating cancer and for inhibiting cancer cell proliferation, where the cancer is mesothelioma, and is selected from Hodgkin lymphoma, non-Hodgkin lymphoma, squamous cell carcinoma, breast cancer and colorectal cancer. Sequences ACC47365-366 represent positive and negative strands of NF-kappaB DNA binding assays for determining alpha-MSH inhibition of NF-kappaB in cancer cells
can reduce the viability of microbes, reduce the germination of yeast, kill microbes, treat inflammation associated with microbial infection, increase the accumulation of CAMP in microbes and inhibit replication and

AAT30581-T30614 represent target binding regions (TBR) of a probe of the invention. The probe of the invention contains a TBR, a booster binding region (BBR), and an optional support or attachment (OSA). The target binding assembly (TBA) recognised by the probe, contains at least one nucleic acid recognition unit (NAR), and optionally a linker sequence, an assembly sequence (see AAR95994-R85998), an asymmetry sequence, and an OSA. The assembly sequence and asymmetry sequence (see AAR96007), and an OSA. The assembly sequence and asymmetry sequence are responsible for the folding and association of the NARs. The NARs (see AAR96007), and an OSA. The man immunodeficiency virus (HPV) E2, HPV LTR, human immunodeficiency virus (HPV) E2, HPV, and control over the Paget of the TBA. The method is nighly sensitive, and has a high degree of sepecificity. The method can be used for detecting specific nucleic acid sequences, including those found in human cells, in HIV, HPV, and other nucleic acid containing systems, including bacteria and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

invention. The probe of the invention contains a TBR, a booster binding invention. The probe of the invention contains a TBR, a booster binding invention. The probe of the invention contains a TBR, a booster binding assembly, and an optional support or attachment (OSA). The target binding assembly (TBA) recognition unit (NAR), and optionally a linker sequence, an assembly sequence (see AAR95994-R95998), an asymmetry sequence (see AAR95066), a nuclear localisation signal sequence (see AAR9507), and an OSA. The assembly sequence and asymmetry sequence are responsible for the folding and association of the NARS. The NARS (see AAR95965-CTC for the folding and association of the NARS. The NARS (see AAR95965-CTC FOY LOTE). THE NARS (HIV) LTR and Tat binding units. The linker sequence is an olisopeptide, which does not interfere with NAR function, but provides stability and control over the spacing of indicator, or other means of localisation of the probe. The probe can be used in a method for detecting or localisation of the probe. The probe can be caid sequence (TNA). The method is highly sensitive, and has a high degree of specificity. The method can be used for detecting specific nucleic acid sequences, including those found in human cells, in HIV, and other nucleic acid containing systems, including bacteria and
```

The present sequence is an oligonucleotide used to determine the level of NF-KB activity in human UI cells treated with alpha-melanocyte stimulating hormone (alpha-MSH). Alpha-MSH and its derivatives were shown to inhibit TMF-alpha induced NF-KB activation and binding. Alpha-MSH and its derivatives have potent antipyretic and antiinflammatory properties, yet they have extremely low toxicity. A uro-genital condition treatment system has been developed that comprises a carrier and a polypeptide including a sequence derived from alpha-MSH. The system may be used to treat a uro-genital condition such as vaginitis, cystitis, urethritis, or balanoposthitis. It may also be used to prevent toxic shock syndrome and infection from sexually transmitted diseases, and to treat an antibiotic resistant microorganism. The polypeptides used in the treatment system can reduce the viability of microbes, treat inflammation associated with microbial infection, increase the accumulation of cAMP in microbes and inhibit replication and

Treating uro-genital conditions, such as vaginitis, cystitis, urethritis, or balanoposthitis comprises using alpha-melanocyte stimulating hormone or a derivative of it.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 29,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 1, Application US/09844915

Patent No. 6936468

GENERAL INFORMATION:
APPLICANT: Robbins, Paul D.
APPLICANT: Lu, Lina
APPLICANT: diannoukakis, Nick
TITLE OF INVENTION: FOR ENHANCING TOLEROGENICITY IN A HOST AND METHODS FOR
TITLE OF INVENTION: PRE USE OF TOLEROGENICITY IN A HOST AND METHODS FOR
TITLE OF INVENTION: MAKING THE SAME
CURRENT APPLICATION NUMBER: US/09/844,915
CURRENT APPLICATION NUMBER: 05/02/04.29

PRIOR APPLICATION NUMBER: 05/02/04.29

NUMBER OF SEQ ID NOS: 7
SEQ ID NO 1
